

William 'Bill' Anders

Lunar module pilot for Apollo 8 – the first lunar orbit mission in December 1968. Anders passed away on June 7, 2024.

Thanks to Dr. Portell for the idea

Objective 2:

Raise Awareness and Understanding of One Health as an Approach to Address Health Issues Originating at the Human-Animal-Environment Interface and Facilitate Knowledge Exchange and Capacity-Building

Objective 2.1: Review Examples and Share Best Practices for Operationalizing the One Health Approach Across Countries in Europe and Central Asia

- What best practices or successful initiatives has your country implemented that could serve as a model for others in the region?
- How have you addressed the challenges of operationalizing the One Health approach at the national and local levels?
- What specific strategies have proven effective in fostering collaboration between human, animal, and environmental health sectors in your country?

Objective 2.2: Provide Updates on Recent Strategic Developments at the Global and Regional Levels

- How have recent strategic developments such as the AMR Roadmap, Budapest Declaration, and Global Biodiversity Framework influenced your country's One Health policies and actions?
- What are the key takeaways from the One Health Joint Plan of Action and Implementation Guide that you find most relevant to your national context?
- How can we better disseminate these strategic developments to ensure all stakeholders are informed and engaged?

Chairs
Ottorino Cosivi and Amina Benyahia

An acknowledgement of the challenges associated with cross sectoral/cross
discipline collaboration

An acknowledgement of the challenges associated with cross sectoral/cross discipline collaboration

Awareness

Understanding

Desire

How do we overcome these barriers?

How do we overcome these barriers?

Desire

Necessity

Requirement

Consider all levels of society – from policy makers to general public, professional to general

Facilitate regular meetings to incentivise / create cross discipline discussion at a different levels. Identify wins to build and maintain momentum

e.g. Irish AMR plan has created a dialogue platform that continues and has evolved to focus on other topics

Build programmes of engagement that create opportunities for relationships to develop and trust to build.

e.g. Social events, brunches, workshops in nice locations

Understanding how best to talk to people, creating bespoke messages depending on the audience.

e.g. School of communication collaboration in Lisbon

Working with the different sectors and speaking to the people on the ground.

Working with them rather than dictating to them.

Identifying their desires and needs and building them into the approach

e.g farming community and other stakeholders

e.g. Antibiotic stewardship with humans – regional experts/champions that produce information and dialogue with doctors that is local and bespoke.

Benchmarking is effective

Identify a common enemy to drive a need for cross discipline/sectoral collaboration

e.g. COVID, MRSA in pigs and humans, Avian Influenza, AMR

Focus on the consumer – knowledge within the general population can apply pressure to industry and policy makers

e.g. Building knowledge about antibiotics in meat creates a consumer that desires antibiotic free meat and therefore increasing pressure on industry and government to change.

e.g. Citizens assemblies to build pressure

Create equal accountability

e.g. In Netherlands multiple ministers are equally accountable for certain action plans

Create legislation that requires cross discipline engagement and accountability

e.g. In Luxembourg, there is a requirement in legislation that multiple ministries must work together on the management of water in the country

e.g. In Ireland there is a requirement for multiple ministries to work together on food safety

e.g. Antibiotic use in the veterinary sector is much more closely controlled compared to human medicine.

Change in this sector has been forced rather than requested and has therefore been much more responsive

Objective 2:

Raise Awareness and Understanding of One Health as an Approach to Address Health Issues Originating at the Human-Animal-Environment Interface and Facilitate Knowledge Exchange and Capacity-Building

Objective 2.1: Review Examples and Share Best Practices for Operationalizing the One Health Approach Across Countries in Europe and Central Asia

- What are the key takeaways from the One Health Joint Plan of Action and Implementation Guide that you find most relevant to your national context?
- How can we better disseminate these strategic developments to ensure all stakeholders are informed and engaged?

Objective 4: Provide Inputs for Member States, Quadripartite Organizations, and Partners for Embedding the One Health Approach into Relevant Priority Areas of Work and Resource Mobilization Across Sectors

What specific inputs or recommendations would you suggest to better embed the One Health approach into the work of Member States?

- How can we mobilize resources more effectively to support One Health initiatives at the regional and national levels?
- What areas of work or sectors require the most attention and resources to effectively implement the One Health approach?

Objective 4: Provide Inputs for Member States, Quadripartite Organizations, and Partners for Embedding the One Health Approach into Relevant Priority Areas of Work and Resource Mobilization Across Sectors

What specific inputs or recommendations would you suggest to better embed the One Health approach into the work of Member States?

- How can we mobilize resources more effectively to support One Health initiatives at the regional and national levels?
- What areas of work or sectors require the most attention and resources to effectively implement the One Health approach?

Create a narrative around One Health that is driven by bespoke examples
The positive of taking a One Health approach and the negative of not taking it
Go beyond the obvious examples associated with AMR Zoonotic disease

Facilitate and drive research in One Health to support the narrative and encourage evaluation after projects have ended

Develop a short simple implementation toolkit / 'how to guide' that explains , encourages, facilitates a One Health approach.
- Something that is accessible, easy and straightforward

Identify or build a network of champions in different disciplines that are embedded into government structures

Engage with them, facilitate them, encourage them to build awareness and drive change

Improve representation from all disciplines to increase buy in, improve togetherness, improve a feeling of involvement

- Consider a broader invitation list for meetings such as this (More discipline specific representatives)
- Consider broadening the quadripartite to increase prominence of plant health

Lean on OHHLEP a little bit more to provide leadership, perhaps make them more obvious/more prominent within the community

Encourage and facilitate governments to sign resolutions to implement a One Health approach – this creates focus and places emphasis on One Health

- Develop innovative education tools such as social media, Instagram live, reels, escape rooms, gamification of communication
- Develop educational resources that are bite ready and easy/cheap to roll out
- Think beyond Universities
- Leverage World One Health Day more effectively
- One Health is Global so we must think about how to educate globally so that One Health can become a reflex and not a decision

Areas of neglect

- Fundamental research
- Disciplines or topics beyond the immediates –
behavioural sciences, anthropology, , multiple environmental areas, mental health, Law, engineering, cancer, non-communicable diseases, equity,
- Engaging with other disciplines and engaging on different topics allows an evolution of language and engagement that creates equity, peer learning opportunities and increased ability to avoid unintended consequences
