

Multi-regional Whole Journey Scenario Workshop on Long-Distance Transport by Land and Sea

Europe – Middle East – North Africa
13–15 January 2026, Amman, Jordan

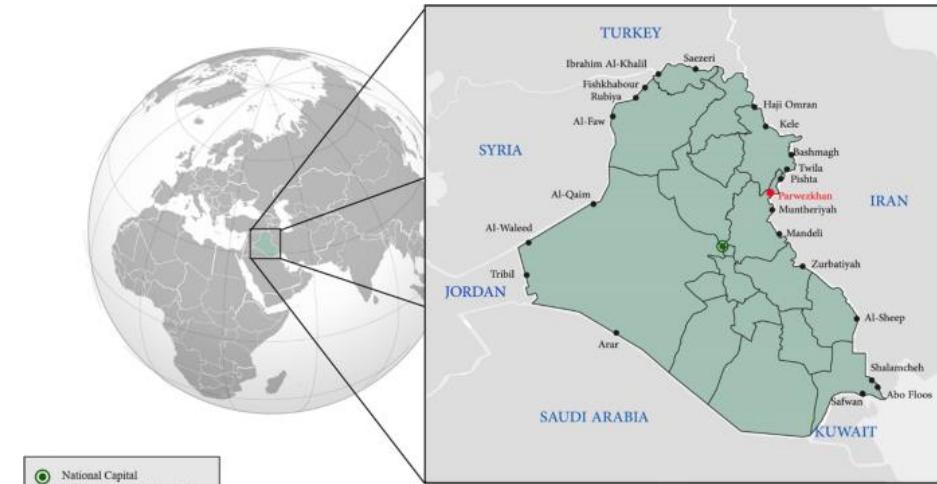

Dr. Ali Othman

Overview of country livestock transport and trade

- **Overview of country livestock transport and trade**
- Iraq is mainly an **importing country** for live animals.
- **Long-distance land transport** is the most common mode, mainly for sheep and cattle.
- **Sea transport** is used through southern ports for imported livestock.
- Animal movements increase seasonally, especially before religious and market peaks.
- Main control points include **land border crossings, international airports, and seaports**, all with veterinary quarantine presence.

Competent Authority(ies)

- The **Veterinary Authority under the Ministry of Agriculture** is responsible for animal welfare during transport by land and sea.
- Other involved authorities include **Customs, Border Police, Port Authorities, Transport Authorities, and Security Services**, working in coordination at border posts.

National animal welfare standards

- National regulations require **veterinary inspection of animals before transport and at points of entry**.
- Animals must be **fit to travel**, meaning able to stand, move, and free from severe injury, advanced disease, or extreme exhaustion.
- **Veterinary health certification** is mandatory for cross-border transport.
- Record keeping is applied at border posts, mainly for inspection and certification purposes.
- General standards exist for vehicles and holding facilities, but **technical details are not fully aligned with WOAH standards**.

Competence of personnel

- There is **no formal national certification system** for animal handlers and drivers specific to animal welfare.
- Competence is largely based on experience, with **limited structured training** on animal welfare during transport.

Implementation of the standards

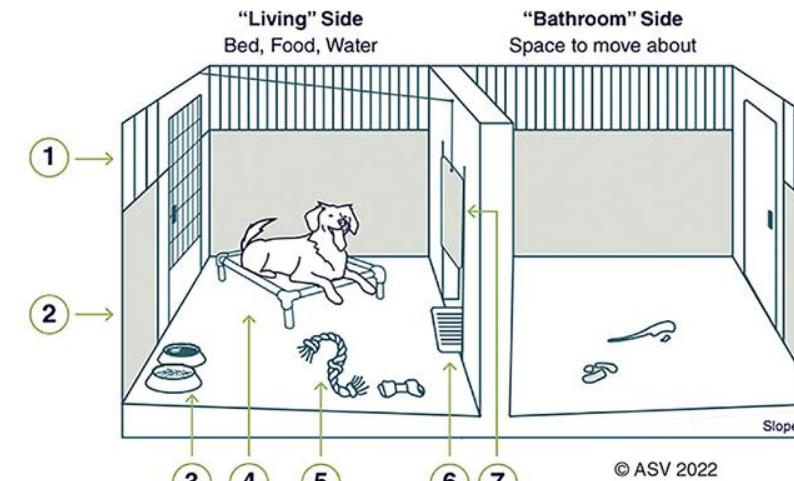

- Animal welfare standards are implemented through **routine veterinary inspections** at border control posts
- Inspections focus on **visible clinical signs and obvious welfare problems**.
- Non-compliance may result in **corrective actions, temporary holding, or refusal of transport**, depending on severity.
- Implementation during long-distance transport remains **challenging due to infrastructure and time constraints**.

Monitoring and evaluation

- Monitoring is based on **inspection reports and routine controls** at entry points.
- Data on injuries or mortality during transport are **not systematically collected or analyzed**.
- There is **no national evaluation framework** to assess the overall effectiveness of animal welfare measures.

1. Open Bars
 - Interaction
 - Ventilation
2. Partial Visual Barrier
 - Retreat space
 - Interaction choice
3. Food and water
4. Bed or Crate Den
 - Soft resting place
 - Retreat space
5. Toys
6. Floor slope toward drain
 - Faster drying
 - Durable cleanable materials
7. Guillotine door
 - Ease of daily care
 - Staff safety latch outside
 - Retreat space
 - Open except during cleaning

Cross-border transport of animals

- **Before departure:** Veterinary inspection and official health certification are required.
- **During transit:** Checks may occur at border posts; rest and watering depend on available facilities.
- **At arrival:** Animals are inspected and quarantined if necessary.
- **Reporting problems:** There is **no standardized feedback mechanism** to report serious welfare problems to the sending authority; reporting is done case-by-case.

Conclusions

- Iraq is **partially compliant** with WOAH standards on animal welfare during long-distance and cross-border transport by land and sea.
- **Main gaps and challenges:**
 - Limited alignment of national legislation with WOAH Chapters 7.2 and 7.3
 - Insufficient infrastructure at some border posts
 - Lack of structured training for handlers and drivers
 - Limited monitoring and data collection
 - Absence of a formal cross-border reporting system
